

CLAIMS

1. A method of identification and control of handling of keys and the like, wherein

- each key or the like is associated to an identification and control device (3),

5 - which is used with a pin-like, hollow shell (26), in which a printed circuit card (42) and a chip (43) are mounted, the latter being loaded with a unique code for each identification and control device (3),

- and which is inserted into a hole (23) in said local control unit (2),

- which is connected to a control center (4),

10 - into which an identification code of the user being fed

- with transmission of said code to said unit (2),

- from the printed circuit card (42) and the chip (43) of said device (3) and via contact means (19) information is sent to the printed circuit card (18) of the local control and indication unit (2),

- and in which control center (4) and unit (2), respectively, removability and reinsertion, respectively, of each control device (3) are registered and indicated, respectively,

15 - the control and indication unit (2) is mounted in a key cabinet or the like, locked by a code lock,

- into which a personal code is fed by the user in order to be able to open the cabinet,

- in addition to a release of the door to the key cabinet or the like, a signal to the printed circuit card (18) of the unit (2) being forwarded, for each insertion position (23) for an identification and control device (3) authorization and/or non-authorization being indicated, particularly by a diode lamp (25) showing a green light for authorization and a red light for non-authorization,

20 - when one or several keys are removed with authorization, a signal is sent via the printed circuit card (18) of the unit (2) to said control center (4) having a central printed circuit card, in which the removal is registered and stored,

25 - when a removal without authorization is done, an alarm signal in a similar way is sent to said center and forwarded to e.g. an alarm device,

- up to the return of the key/the keys or the like, it/they and/or the attached identification and control device (3), when e.g. a door is unlocked, will send a signal, which is registered in said center and/or another center,

30 - when the key/the keys or the like is (are) returned, associated diodes will emit light, when the user has given his code, in order to indicate, where the key/the keys is (are) to be inserted, which also will be registered in said center,

35 - via any of said centers, possibly via a connected PC, in each phase it is possible to control, who has removed which keys, and possibly also to determine the point of time for a removal, an unlocking, a locking, a return etc., preferably also security functions being integrated, e.g. a return of keys before a certain specified point of time.

2. An apparatus (1) for carrying out the method for identification and control of handling of keys or the like according to claim 1, wherein

- each key or the like is associated to an identification and control device (3),
- which is used with a pin-like, hollow shell (26), in which a printed circuit card (42) and a chip (43) are mounted, the latter being loaded with a unique code for each identification and control device (3),

- and which is inserted into a hole (23) in said local control unit (2),

- which is connected to a control center (4),

- into which an identification code of the user being fed

- with transmission of said code to said unit (2),

- from the printed circuit card (42) and the chip (43) of said device (3) and via contact means (19) information is sent to the printed circuit card (18) of the local control and indication unit (2),

- and in which control center (4) and unit (2), respectively, removability and reinsertion, respectively, of each control device (39) are registered and indicated, respectively,

- the control and indication unit (2) is mounted in a key cabinet or the like, locked by a code lock,

- into which a personal code is fed by the user in order to be able to open the cabinet,

- in addition to a release of the door to the key cabinet or the like, a signal to the printed circuit card (18) of the unit (2) being forwarded, for each insertion position (23) for an identification and control device (3) authorization and/or non-authorization being indicated, particularly by a diode lamp (25)

showing a green light for authorization and a red light for non-authorization,

- when one or several keys are removed with authorization, a signal is sent via the printed circuit card (18) of the unit (2) to said control center (4) having a central printed circuit card, in which the removal is registered and stored,

- when a removal without authorization is done, an alarm signal in a similar way is sent to said center and forwarded to e.g. an alarm device,

- up to the return of the key/the keys or the like, it/they and/or the attached identification and control device (3), when e.g. a door is unlocked, will send a signal, which is registered in said center and/or another center,

- when the key/the keys or the like is (are) returned, associated diodes will emit light, when the user has given his code, in order to indicate, where the key/the keys is (are) to be inserted, which also will be registered in said center,

- via any of said centers, possibly via a connected PC, in each phase it is possible to control, who has removed which keys, and possibly also to determine the point of time for a removal, an unlocking, a locking, a return etc., preferably also security functions being integrated, e.g. a return of keys before a certain specified point of time.

3. An apparatus according to claim 2, **characterized in that** said control and indication unit (2) preferably is designed as a strip for a plurality of identification and control devices (3), which have a fastener (29) at their end for one or several keys, in that said unit (2) comprises a frame work (5), U-shaped in cross-section and preferably made of metal sheet, in which the longitudinal edges of the legs (11, 13) end in narrow flanges (6), extending in opposite directions in relation to each other and having a few additional projecting eyes (7), designed to receive screws or the like for the fastening of the unit to a wall, in that in the U-profile a fastening profile (8) is inserted having the same length, in that the substantially L-shaped fastening profile has a base leg (9), which lies in the same plane as the flanges (6), to the free longitudinal edge of this leg a bearing leg (10), which is shorter in profile, being connected, designed to abut the inner side of one of the legs (11) of the frame work, in that the second leg (12) of the fastening profile (8) runs plane parallel to the second leg (13) of the frame work at a distance inside it, and in that bolts (15) extend through the front (14) of the frame work (5) and the base leg (9) and are provided with spacing sleeves (16), which fasten these two parts to each other to a manageable unit.

4. An apparatus according to claim 3, **characterized in that** the leg (12) of the fastening profile (8) via fastening means (17) supports a printed circuit card (18), on its side, which faces the leg (11) of the frame work, contact means (19) extending from the printed circuit card towards said leg of the frame work and comprising a ribbon, plane parallelly disposed in relation to the front (14) of the frame work, said ribbon comprising electric cables, separated from each other, one for each identification and control device (3), and in that the base leg (9) of the fastening profile supports with its side, which faces the front of the frame work, via fastening means (20) a fastener (21) for permanent magnets (22), which project towards the front of the frame work, one for each identification and control device.

5. An apparatus according to claim 4, **characterized in that** the front of the frame work has a plurality of holes (23), which correspond to said number of identification and control devices (3), suitably having inwardly bent collars (24), designed to have a guiding effect, in that the front of the frame work is provided with diode lamps (25), connected to said printed circuit card (18) and associated with said holes and designed to indicate e.g. authorization and non-authorization, when an identification and control device (3) has been fully inserted.

6. An apparatus according to any of claims 2-5, **characterized in that** the pin-like shell (26) of said identification and control devices (3) is made of a light metal, the outer end (27) of the shell (26) preferably being pointed like a wedge and provided with a through hole (28) across it, designed to receive a key ring (29), to which one or several keys can be fastened, in that the shell
